

## Sidgwick's Effective Atomic Number (EAN) Rule:

Sidgwick suggested that the "when the ligands donate the pair of electrons to the central metal atom or ion, the total no of electrons on the central metal atom or ion including those gained from ligands in the bonding is called effective atomic number (EAN) of the central metal ion.

This rule can also be stated as follows:

⇒ If the total no of electrons i.e. EAN of the central metal atom is equal to the atomic no of the inert gas, such compounds are stable and diamagnetic.

⇒ If the total no of electrons i.e. EAN of the central metal atom is not equal to the atomic number of the inert gas, such compounds are unstable and paramagnetic.

Formula to calculate EAN of central metal atom in complex ion:

$$EAN = (Z - X) + n \times Y$$

Z = Atomic no. of the central metal atom.

X = Oxidation no of the central metal ion.

n = no of ligands

Y = no of electrons donated by one ligand

Example - Calculate the EAN of the cobalt III in the  $[\text{Co}(\text{NH}_3)_6]^{3+}$

$$\text{Solution} = \text{EAN of } \text{Co}^{3+} = (Z - X) + n \times y$$

$$(27 - 3) + 6 \times 2 = 24 + 12 = 36$$

The EAN of the  $\text{Co}^{3+}$  ion is equal to the atomic number of Kr ( $Z = 36$ )

$$\text{no of unpaired electrons} = \text{Atomic no of Kr} - \text{EAN}$$

$$36 - 36 = 0$$

so it contains no unpaired electrons. Hence it is stable and diamagnetic.

Example - Calculate the EAN of  $\text{Cu}^{2+}$  in the  $[\text{Cu}(\text{NH}_3)_4]^{2+}$  ion

$$\text{Solution} = \text{EAN of } \text{Cu}^{2+} = (29 - 2) + 4 \times 2 = 27 + 8 = 35$$

$$\text{no of unpaired electron} = 36 - 35 = 1$$

Paramagnetic

Example - Calculate the EAN of  $\text{Cr}^{3+}$  in the  $[\text{Cr}(\text{NH}_3)_6]^{3+}$  ion

$$\text{Solution} = \text{EAN of } \text{Cr}^{3+} = (24 - 3) + 6 \times 2 = 21 + 12 = 33$$

$$\text{no of unpaired electrons} = \text{Atomic no of Kr} - \text{EAN}$$

$$36 - 33 = 3$$

Paramagnetic.

Example - calculate the EAN of  $\text{Pd}^{4+}$  in the  $[\text{Pd}(\text{NH}_3)_6]^{4+}$  ion

$$\text{Solution} = \text{EAN of } \text{Pd}^{4+} = (46 - 4) + 6 \times 2 = 42 + 12 = 54$$

$$\text{no of unpaired electrons} = \text{Atomic no of Xe} - \text{EAN}$$

$$54 - 54 = 0$$

diamagnetic

Example - calculate the EAN of  $\text{Pt}^{4+}$  in the  $[\text{Pt}(\text{NH}_3)_6]^{4+}$  ion

$$\text{Solution} = \text{EAN of } \text{Pt}^{4+} = (78 - 4) + 6 \times 2 = 74 + 12 = 86$$

$$\text{no of unpaired electrons} = \text{Atomic no. of Rn} - \text{EAN}$$

$$86 - 86 = 0$$

Diamagnetic

Problem- Calculate of EAN of the central metal atom of complexes.

- (I)  $[\text{Fe}(\text{CN})_6]^{4-}$  (II)  $[\text{Ag}(\text{NH}_3)_4]^+$  (III)  $[\text{Fe}(\text{CN})_6]^{3-}$   
 (IV)  $[\text{Ni}(\text{CN})_4]^{2-}$  (V)  $[\text{Pt}(\text{NH}_3)_2\text{Cl}_2]^0$  (VI)  $[\text{Ag}(\text{NH}_3)_2]^+$   
 (VII)  $[\text{CuCl}_2]^-$  (VIII)  $[\text{Co}(\text{CN})_6]^{4-}$  (IX)  $[\text{Mn}(\text{H}_2\text{O})_6]^{2+}$   
 (X)  $[\text{Ni}(\text{en})_3]^{2+}$

Answer- (I) 36 (II) 54 (III) 35 (IV) 34 (V) 84  
 (VI) 50 (VII) 32 (VIII) 37 (IX) 35 (X) 38
